

Why doesn't my doctor know about Candida?

- **There is no reliable lab test.**

Because yeast gradually invades organs and attaches as a parasite to the outside of cells without killing them (unlike other microbes which invade cells, cause tissue destruction, form abscesses and/or are abundant in the blood), typical lab tests looking for cultures, metabolites, antibodies or signs of infection cannot accurately measure Candida overgrowth levels in the body.

- **Candida develops slowly.**

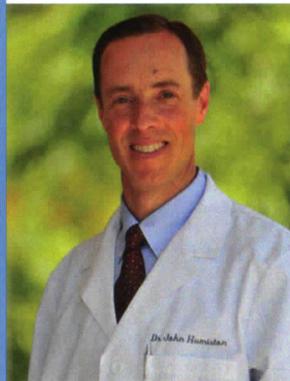

The symptoms of Candida take years to develop, so its causes and effects are not always obvious.

- **Symptoms seem unrelated.**

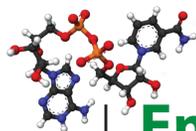

Candida affects multiple organ systems, which can make its symptoms seem like a group of unrelated problems.

CandidaMD

CandidaMD exists to raise awareness and educate about Candida and provide effective treatment to those currently suffering from it. CandidaMD was founded by John E. Humiston, M.D., a family practice physician and chronic disease specialist who has worked with thousands of Candida patients since 2004.

Do I have Candida?

Have you ever (especially in childhood) done any of the following repeatedly:

- Taken antibiotics?
- Swam in chlorinated pools?
- Consumed a lot of alcohol or consumed alcohol regularly (especially beer, red wine or vodka)?
- Used anti-inflammatory steroids (such as prednisone, hydrocortisone, Advair, Flonase, etc.)?
- Lived in a moldy house?
- Craved or consistently eaten excess chocolate, bread, sweets, nuts or peanuts, apples, grapes, bananas, aged cheese, yogurt or other dairy, vinegar, pickles, ketchup or kombucha?
- Consumed large amounts of milk when growing up?
- Had direct exposure to pesticides, as from farm fields?
- Used hormonal birth control?
- Suffered from any of the conditions listed on the left?

If you checked any of the boxes above, you may have a Candida problem.
